Shell Programming –II

1. Write a Shell script to read a user name and to find whether the user is currently logged or not.
2. Write a Shell script that accepts an alphabet from the user and displays all filenames starting with that alphabet in the current working directory.
3. Write a Shell script to find whether the file has execute permission or not (without using test command).
4. Write a Shell script to find the file with the maximum size in the current working directory. (without using sort command)
